

Multi-fidelity problem

self-driving laboratory

candidate pool $\mathcal{X}_{\text{cand}}$

13 benchmarks: 4 synthetic · 9 chemistry & materials

Low fidelity

simulation
cheap, abundant

High fidelity

experiment
costly, scarce

Controlled comparison

fix budget · schedule · capacity

→ **vary only the surrogate**

**Gaussian-process
(GP) family** ×3

MFGP · DKL
sparse MFGP

**Transfer-learning
(TL) surrogates** ×9

residual transfer + Bayesian linear-regression head

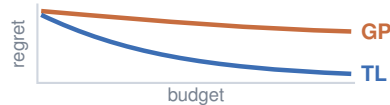

Transfer-learning wins

on chemistry & materials benchmarks

Better solutions

regret vs. budget

TL $\geq$ GP on all 9 chemistry & materials pools

Faster

compute per optimization loop

GP

TL

up to 45× fewer FLOPs
